

Introduction to Web Technologies Assignment 1

Anatomy of a Real Page and Written Explanation

Project: Kamzina 199 Building Materials Store

Student: Damir Shuitinov

Group: SE-2532

Organization: Building materials store, 199 Kamzina Street, Pavlodar

September 2026

Task A Anatomy of a Real Page

I analyzed the home page of Megastroy Kazakhstan, a real construction and repair retailer. The page was opened and its downloaded HTML source was inspected on 12 September 2026. Its purpose is similar to my project because it presents building materials, store services, contacts and product search.

Source item	Observed value
URL	https://megastroy.kz/
Doctype	<!DOCTYPE html>
Language	lang="ru" and xml:lang="ru"
Charset	UTF-8 through the Content-Type meta declaration
Viewport	initial-scale=1.0, width=device-width, maximum-scale=1
Title	Construction store Megastroy Buy building materials in Kazakhstan
Meta tag 1	keywords: repair, construction, catalogue and product terms
Meta tag 2	description: Kazakhstan repair and construction catalogue summary
Meta tag 3	theme-color: #117d11

Semantic structure and generic containers

Element	Count in source	How it is used
header	1	Top site header
nav	2	Navigation areas
footer	1	Store and legal information
main, section, article, aside	0	No matching landmarks or sections found
div	861	Wrappers, menus, grids, search blocks and layout columns

Forms and tables

The source contains three repeated search forms. Each form points to /catalog/, uses a text input named q and a submit button. No explicit method is declared, so the browser defaults to GET. The search inputs have placeholders but no visible labels connected with the for and id attributes. The source also contains six tables. None has a caption, thead or th cells; four contain tbody. Their one-row structures indicate layout use rather than accessible data tables.

Three structural problems and how I avoided them

Problem in Megastroy	
No main landmark wraps the page's unique content.	Every project page has one main element after the repeated header.
Generic div elements perform most structural work.	I use header, nav, main, section, article, aside, figure and footer when their meanings fit. The single div only groups two form buttons.
Tables have no captions or header cells.	products.html uses caption, thead, tbody and th cells with col and row scope values.

Task A Screenshots

Hand Drawn Page Structure

Task B Written Part

A web page is a document that integrates structured HTML, text, links, media and metadata. I open one of my files, the browser reads the HTML from beginning to end, generates a Document Object Model, and translates each element and shows the structure. It also follows the references including the three local image paths. This assignment does not use any CSS or JavaScript. Used semantic tags in specific locations. However, in the index.html file, the store introduction and contact details are on the main since they are the unique content of the page, while the customer information is an aside since it supplements the introduction. The material-selection guidance in products.html relies on the term article as the advice is self-explanatory. The request controls are located in order.html, inside form and fieldset, which provide more meaningful descriptions of what they're used for than div elements. The Submit button today will not save or place an order at the shop. This form uses GET, and is pointed to by order.html, so the browser validates the required fields, encodes the names and values of those fields into a query string, and reopens order.html. This action can be replaced in a subsequent assignment with a real server endpoint.
